

Because it's timely to turn over an old leaf.

Why Compost?

As landfills continue to reach capacity, more and more individuals and local governments are turning to backyard composting as a way to reduce waste and contribute to the recycling movement.

The turner is specially designed to get right down to the bottom of a compost pile and is particularly suitable for The Earth Machine. It easily lifts and mixes the more decomposed bottom layers with newer compost. Simply plunge it in and out several times weekly. The act of turning up the older compost aerates the pile and mixes compost-causing bacteria throughout, speeding up the process.

Aeration of the compost pile is also important because it promotes the flow of moisture through the pile. More air also reduces odour. And if you reduce odour, flies and vermin (including nesting rats and mice) will not be attracted to the pile.

It's an easy way to faster compost.
